

vokavimas API

Upload a PDF — get back the list of recipients to mail it to. · v0.1.0

One endpoint. Send a document, receive a JSON array of recipients (who to mail, and which page each one's documents start on) for batch enveloping.

```
POST https://vokavimas.softa.lt/v1/extract
```

Quick start

```
curl -X POST https://vokavimas.softa.lt/v1/extract -F "file=@document.pdf"
```

Response — a JSON array, one entry per recipient, in page order:

```
[
  { "page_number": 1, "page_count": 2, "name": "Vardenis Pavardenis",
    "address": "Pavyzdžio g. 1-2, 00001 Vilnius" },
  { "page_number": 3, "page_count": 1, "name": "Vardenė Pavardenė",
    "address": "Pavyzdžio g. 3-4, 00002 Kaunas" }
]
```

Each recipient's documents start at `page_number` and span `page_count` pages — put exactly those pages in one envelope.

Sending the document

Way	How
Upload (usual)	multipart form field <code>file</code> = the PDF
By URL	<code>?url=https://.../doc.pdf</code> — the server fetches it
Raw body	<code>Content-Type: application/pdf</code> , the PDF bytes as the body

Options (query parameters)

Parameter	Effect
?full=true	return { customers, review, meta } instead of the bare list
? split_names=true	split the name into given-name + a surname field
?mode=async	return a job_id at once; poll GET https://vokavimas.softa.lt/v1/jobs/<id> (for very large files)

Response fields

Field	Description
page_number	1-based page where this recipient's documents start
page_count	how many pages belong to this recipient (all go in one envelope)
name	recipient name, verbatim (given name only when split_names=true)
address	full postal address

Errors

Status	Meaning
200	OK
422	file isn't a usable PDF
413	file too large
400	no document in the request
401	missing/invalid key (only when auth is enabled)

Authentication

If the service is configured with API keys, send one in the X-API-KEY header; otherwise the API is open.

Good to know

The call is **synchronous**: it blocks until done and returns the finished JSON (no streaming, no polling). A 2000-page invoice takes ~25 s; large scanned files can take a few minutes — use a generous client read timeout, or `?mode=async`.

More examples

```
# full output + split the name into given-name + surname
curl -X POST "https://vokavimas.softa.lt/v1/extract?full=true&split_names=true" \
  -F "file=@document.pdf"
```

```
# Python
import requests

r = requests.post("https://vokavimas.softa.lt/v1/extract",
                  files={"file": open("document.pdf", "rb")})
recipients = r.json()
```
